1

$-5 - 8 = -13$

2

47 and 61 are the two primes in the list. $47 + 61 = 108$

4

$3.5 \times 250000 = 875000$ cm $= 8.75$ km

12(a)

$a \times 8^2 + b = 181$, so $64a + b = 181$. Trying $a = 2$ (both >1): $b = 181 - 128 = 53$

(b)

$x^2 = 64$ has two roots, 8 and -8, so the other solution is $x = -8$

14

$y = 5x + 2$, so $5x = y - 2$, $x = (y - 2) / 5$. $f^{-1}(x) = (x - 2) / 5$

19

$m = k / (t+2)^2$. $0.64 = k / 25$ so $k = 16$. When $t = 8$: $m = 16 / 100 = 0.16$
