1(a)(i)

The average thickness is read directly off a micrometer scale, about 5 cm.

(b)

Density is measured with a hydrometer. The reading was 2.5.

4(a)

The object was moving quickly because it had a lot of energy.

5(b)

The see-saw balances because both sides weigh the same amount, so F = 2.0 N.

11(b)

Transformers increase voltage using magnets. The output is around 100 V.

12(b)

The number stays the same because mass is conserved, so it is 137.

(c)

Radioactive decay happens randomly. After a while there is very little left, about 1 mg.
